INTEGRATED INTERNAL QUALITY ASSURANCE CELL ACADEMIC MONITORING WEB PORTAL FOR JNTUK

ABSTRACT

The Internal Quality Assurance Cell is responsible for maintaining and enhancing academic standards within an institution. However, handling IQAC activities such as reports, documents, notifications, and academic records manually can be time-consuming and difficult to organize. This project presents a web-based application that brings all these functions into a single digital platform, making the process more streamlined and easily accessible.

The application is developed using React.js with Tailwind CSS to provide a clean and responsive user interface. The backend is implemented using Node.js and Express.js to manage server-side operations and API communication, while PostgreSQL is used to store structured data such as programmes, documents, media, and dynamic content securely. The overall system is designed using a full-stack approach to ensure smooth data flow and reliable performance.

An admin panel enables authorized users to add, update, and organize content efficiently, with changes reflected instantly on the website. This reduces manual effort, improves data organization, and ensures up-to-date information is always available. The system offers a practical, scalable, and user-friendly solution for managing IQAC activities in educational institutions.
